10 Stellar Reasons to Choose Nebula Cloud Network Management

Internet connectivity is important to everyone in office, school, hospital, hotel and retail environments. For those looking to explore new galaxies of opportunity, providing internet services quickly, effortlessly and economically – with intergalactic security protection – is essential. And managing multi-site networks containing hundreds of networking devices, with limited IT resources and budgets, is an expansive challenge.

Nebula can help. It offers everything you need to build a secure cloud network – while operating and managing devices, users and networks across multiple locations and buildings, all under a single interface. It even provides full visibility, with real-time alerts to keep you in total control of the entire network. You'll need to prepare your business for blast off:

1 Zero-touch hardware provisioning for rapid deployment. Nebula wired and wireless products can perform auto-configuration after installation, and can even be deployed by non-IT professionals.

2 Nebula mobile app with a built-in QR code scanner that quickly connects a large number of devices to the Nebula control center all at once.

3 Centralized remote management that manages and monitors hundreds of distributed branch sites with a single pane of glass.

4 Comprehensive product portfolio from wired, to wireless, and security, which are built from the ground up for cloud management.

5 Real-time and historical activity views with 24/7 monitoring over the past 6 months for thousands of dispersed networks, devices and users.

6 Over-the-web updates that enable firmware and security signature updates to be delivered seamlessly over the cloud.

7 Multi-tenant role-based administration so supervisors of different organizations can assign different privileges for multiple administrators.

8 Standard-based, limitless and flexible scalability provides the reliable, elegant and efficient benefits of non-proprietary secure network control. The amount of hardware that Nebula can handle is basically unlimited, so networks can grow and change to suit your needs.

9 Annual Bundled licensing model allows you to competitively optimize your IT system no matter your budget.

10 Enterprise-grade security with authentication and encryption, management data/connection loss prevention, firewall implementation and privacy protection is included – to protect your Nebula networks.
